1 ABOUT

These Instructions for Use are intended to provide you with necessary information about Diplomat Adept DA 170model2013, Diplomat Adept DA 130model2013, dental unit. Please, familiarize yourself with information provided in this handout before operating the unit. It is expected, that dental unit will be used by a specialist, familiar with the following instructions for use as well as with the instructions for any other products and applications that are being used in conjunction with a unit. To ensure proper operation installations and/or adjustments should be done by authorized technicians of authorized organization. The utilities requirements as well as the installation requirements specified in Diplomat Adept DA 170model2013, Diplomat Adept DA 130model2013, Instructions for Use must be observed.

Fig. 1.1 Diplomat Adept DA 170model2013

1. Data plate location
2. Main switch location

Fig. 1.3
2 PRODUCT DESCRIPTION

Diplomat DA 170model2013 and DA 130model2013 are stationary dental units with DE20 Lift chair. The pantographs of a control panel with instruments and handpieces and of a operating light are mounted on the spittoon block. The instruments and handpieces, except for syringe, saliva ejector, large and small aspirators, polymerizing lamp, and DP7 camera are controlled with the foot controller. The keyboard with control buttons and light indicators is located on the control panel. The handle enables a smooth repositioning of control panel. In the standard configuration the handle is mounted on the right side of the control panel. The control panel with left-side handle or both left- and right- handles are available upon request. Depending upon the model, spittoon block can be equipped with saliva ejector and with large and small aspirators. Fixed or swiveling spittoon bowl (upon request). The glass cuspidor bowl, rinsing and cup-filling spouts are detachable. The silicone pads on the tray table as well as the silicone handles are detachable and sterilizable. Large and small aspirators' handpieces are also detachable and are disinfection- and sterilization-friendly. Saliva ejector's tips are for single use only. As an optional furnishing, light console-mounted tray tables as well as the pantograph monitors are available upon request.

All the Diplomat DA 170model2013, Diplomat DA 130model2013 units are equipped with a syringe on a control panel.

The following control panel configurations are available:

- 1x syringe
- max. 3 rotary instruments, among which are
  - max. 2 turbines
  - max. 2 micromotors (max. 2x DC motor or max. 2x BLDC motor)
- 1x ultrasonic calculus remover (hereafter UOZK)
- max. 5 instruments with lighting
- 1x polymerizing lamp

Note
You can only configure the dental unit with one specific motor type.

The spittoon block can be fitted with the following instruments:

- 1x large aspirator
- 1x small aspirator
- 1x saliva ejector
- 1x DP7 camera
- 1x polymerizing lamp
- 1x syringe

Notes
UOZK – ultrasonic calculus remover /scaler
PLM - polymerizing lamp
DC motor – brushed motor
BLDC motor – brushless motor

Note
Optional equipment and supplementary equipment (see the current price list).

**INSTRUCTIONS FOR USE**

**DA 170model2013, DA 130model2013**

### 4.1 Unit plate

![Image of unit plate]

1. Designation of the unit type
2. Basic electrical parameters
3. Serial number
4. Production date
5. Mode of operation of the chair

### 5 PRE-INSTALLATION REQUIREMENTS

#### 5.1 Environmental conditions

Do not install in premises with a potential explosion hazard!

#### 5.2 Utility Requirements

**Water**

It is required to use only drinkable water with input pressure of 0.3 MPa to 0.6 MPa and with min. 4 l/min. flowrate. Water should contain no particles larger than 50 µm or in case of occurrence of such 50 the µm advance filter /strainer/ should be installed to prevent pipes' cross-sections from clogging.

**Air**

Oil-free, clean and dry air, with a minimum flow of 55 l/min and a pressure of 0.45 to 0.8 MPa.

**Suction (for cuspidor block configuration with large and small aspirators)**

Static vacuum index must be measured at the spot and must be within the range of min. 0.005 MPa (50 mbar) to max. 0.02 MPa (200 mbar). If the static vacuum index is higher than 0.02 MPa, then suction CONTROL valve should be connected to the suction branch in order to limit the max. vacuum to 0.02 MPa. This regulating valve is not a part of the kit. The suction unit must produce the flowrate of at least 450 l/min. measured at the spot.

**Waste**

The waste /drain/ branch must have continuous slope of min. 1% and min. flowrate of 10 l/min. and must have no sharp bends and sections that might cause backflow. Do not use the same waste branch in conjunction with another dental unit or a basin! It is allowed to use polypropylene or cured polyethylene tubes.

**Caution**

All of the pre-installation and installation operations must be performed in accordance with the applicable standards of the particular country and in coherence with the valid product documentation, which every authorized representative of Diplomat poseses.

**Note**

If the local regulations require an installation of an amalgam catcher, then the cuspidor block without such must be connected to an external amalgam catcher. Amalgam catcher should be installed according to the manufacturer's instructions packed with the product.
Recommended mains fuse rating
Recommended fuse rating for the supply main is 16A. (If using a circuit breaker, use circuit breaker “C” type). No other equipment should be connected to the supply main! Max. Electrical power input of dental unit is 1500 VA. The supply main must conform to prevailing local codes.

Recommendation
The manufacturer recommends installation of an instantaneous residual-current device with 30mA sensitivity, if installation of such does not contradict local regulations. If all the conditions fit the pre-installation requirements, the dental unit can be installed and connected to the utilities.

5.3 Floor surface
The floor must have at least 100 mm thick concrete foundation. The floor slope should not exceed 1%. Antistatic floor is recommended.

5.4 Environment
Ambient temperature range from +10 °C to +40 °C
Relative humidity range from 30 % to 75 %
Atmospheric pressure range from 700 hPa to 1060 hPa

6 ASSEMBLY AND INSTALLATION

Unpacking the unit and inspecting the delivery
Examine the package for any outside indication of damage. If any damage is found do not open the package and notify the forwarding agent or the seller immediately. In case no outside damage is found, carefully open the package and unpack the individual parts of the dental unit. Check all the parts for damage, quantity, etc. according to the list provided in chapter 13 of this Instruction for Use and according to the enclosed check-list.

The installation must be done by the certified service technician only; otherwise no possible future warranty claims will be accepted. The warranty form must be filled out and sent to the manufacturer or the seller.

Note:
Feed the sieves (attached in the small parts pack) in the suction bottle end pieces according to the figure Nr. 10.2.

7 PUTTING THE UNIT INTO OPERATION
1. switch on the compressor and let it get pressurized
2. open the central water supply
3. turn on the suction unit (for cuspidor block configuration with large and small aspirators)
4. turn on the main switch located on the chair (fig. 1.3) – position I, the indication light lights on

The unit is connected to the water and air distribution. After approx. 30 s have passed, the unit is ready for work. It is necessary to wait for approx. 2 mins. For the water to be warmed up to the desired temperature, if the electrical water heater is installed. Do not take out any instruments or press keyboard buttons when turning the dental unit on. The foot controller should be at a standstill.
Upozornenie
Dental chair, foot controller or other things should be positioned so that they do not obstruct dental chair or dentist’s stool motion (see fig.)

Caution
Except for the saliva ejector, large and small aspirators (depending on modification) polymerizing lamp and syringe (on the control panel and on the assistant table) only one instrument can be used or taken out at a time

### 8.1.1 Buttons descriptions

#### Instrument cooling

To turn instrument cooling on while using micromotors, turbine or UZOK press ![icon](image). When indicator light is on or blinking means that "instrument cooling" is on.

Instrument cooling has 2 modes:
- Cooling ON - LED indicator is on (spray coolant) or LED indicator is blinking (water coolant)
- Cooling OFF - LED indicator is off

To toggle between spray coolant and water coolant press and hold the button ![icon](image) for approx. 10 - 16 sec.

#### Reversing rotation of the micromotor

Pressing this button will reverse the micromotor rotation or enable the ENDO function for the scaler. The indicator next to the button shows the status (lit when on).

#### Cup fill

To fill the patient's cup Press and hold this button for more than 1 sec. (factory preset). Pressing and holding the button for more than 4 sec. will allow you to control the amount of water in the patient's cup manually (the cup will be filling until the button is released). Pressing the button fast in less than 1sec. will end the cup filling. Maximum programmed cup filling time is 25 sec. Cup filling time is automatically saved in the memory and will activate automatically next time you use the unit.
**Bowl rinse**

To rinse the bowl press and hold the button for more than 1 sec. Pressing and holding the button for more than 4 sec. will allow you to control rinsing time manually (rinsing will end when the button is released). Pressing the button fast in less than 1 sec. will end the bowl rinsing. Maximum programmed bowl rinsing time is 40 sec. Bowl rinsing time is automatically saved and will activate automatically next time you use the unit.

**Handpiece lighting**

Pressing this button will turn on the lighting of the rotary instruments (turbine, micromotors) and UZOK on or off. (Depending upon modification, this feature is compatible with Amdent Bi-11, Satelec SP NEWTRON LED only). Take the handpiece out of the holder and press the button to turn on the lighting for this particular handpiece. The indicator next to the button shows the status (lit when on). The lighting turns on after a handpiece is put into operation by moving the lever of the foot controller to the right. The lighting turns off automatically when a handpiece is not in use for more than 10 sec. As soon as a handpiece is returned to its initial position the lighting turns off.

**Plus and minus**

Pressing this buttons will increase (decrease) the parameter being set from minimum up to the maximum value.

The buttons set the following:
- the micromotor revolutions /speed/
- the output, if an instrument with output control is used (e.g. ultrasonic scaler)

**8.1.2 Saving the customized settings**

By pressing the instrument illumination button while all the instruments are in their basic positions, the set values of the parameters of the instruments are saved in the internal memory of the unit and are read at starting the unit. Saving of the parameters is indicated by triple beep. The unit remembers the set parameters even after it has been turned off.

**8.1.3 Adjusting water coolant flow**

Use the needle valve on the right bottom side of the control panel to control a water coolant flow.

An individual water coolant flow control for each handpiece is available upon request. In this case, the needle valve is located on the bottom of a control panel directly under the handpiece.

**Fig. 8.3**

**8.1.4 Tray table**

A tray table with a holder for a unit with overhead delivery system is available upon request. Tray table is made of stainless steel and has closed corners. Its dimensions are: 177 mm x 239 mm. To remove tray table from the holder lift it up. (as shown on fig. 8.4).
Stainless tray with open corners is available upon request. Its dimensions are: 181 mm x 280 mm (Fig. 8.5).

The size of both tray table models allows placing „Mini Tray“-type plastic dishes (dimensions: 162 x 238 x 22,2 mm) by „ZIRC Color Code System“ on them (fig. 8.6). DA 170model2013 and DA 130model2013 units are supplied with a tray (140x260 mm.) made of stainless steel.

8.1.5 Operation of individual instruments

Control panel
In addition to below listed instructions, please, follow the instructions given by the manufacturer of a specific product.

Syringe
The syringe is active straight away after withdrawal from the holder. For air press the right button, for water rinse, press the left button and for spray, press both buttons simultaneously.

Turbine
Activate the turbine by withdrawing it from the holder and press a foot controller pedal. To turn the turbine off, release the pedal. It is recommended to run CHIPBLOWER function after use. (If modified with UNO or NOK foot controllers). It is impossible to adjust rotations of a turbine.

Micromotor
Activate the micromotor by withdrawing it from the holder and press a foot controller pedal. To turn the micromotor off, release the pedal. It is recommended to run CHIPBLOWER function after use. (Only possible with UNO or NOK foot controllers).
INSTRUCTIONS FOR USE

Press \( \uparrow \) or \( \downarrow \) button to adjust the RPM in a range of 0-100%. To change micromotor's direction, press \( \bigcirc \) button on the keyboard or press and hold "spray" button on the foot controller for more than 2 and up to 8 sec. It is impossible to change the direction when micromotor is active.

It is possible to adjust RPM from "0" and up until the desired value is reached (as shown on the indicator). Adjust RPM by moving the lever (pedal) on the foot controller. (Only possible with UNO or NOK multi-function foot controllers.)

Micromotor Bien Air MCX

The MCX micromotor by Bien Air:1000-40,000 RPM, max torque 2.5 Ncm. To activate the motor, withdraw it from the holder and then press the pedal (lever) on the foot controller. Release the pedal to turn off the motor. It is recommended to run CHIPBLOWER function every time after using the motor (function is available for UNO or NOK foot controllers). Use \( \uparrow \) and \( \downarrow \) keys to adjust RPM from 0-100 %. See Table 1.

<table>

<td>32000</td>
<td>36000</td>
<td>40000</td>
</tr>
</tbody>
</table>

Table 1

To reverse the direction of rotation, press the \( \bigcirc \) key on the keyboard or press and hold (2 to 8 seconds) the "spray" key on the foot controller. Reversing of rotation is only possible when the motor is idle.

If you use a multifunctional foot controller (UNO or NOK), you can increase the RPM value by pressing down the pedal. The RPM can be adjusted from 100 to the max. preset value.

Note
Pedal's initial position equals 0 and a minimum rpm for motor's activation is 1000 rpm. Thus, when set to 10% (= 4000 RPM), you need to press the pedal quarter way down to activate the motor.

Scaler
Activate the scaler by withdrawing it from the holder and pressing the lever on the foot controller.

Press \( \uparrow \) or \( \downarrow \) button to adjust the output either when scaler is out of the holder or in operation. Press \( \bigcirc \) to enable ENDO function. When ENDO function is active the light indicator is on.

It is possible to adjust output from "0" and up until the desired value is reached (as shown on the indicator). Adjust output by moving the lever on the foot controller. (Only possible with UNO or NOK multi-function foot controllers.)

Polymerizing lamp
The polymerizing lamp is active straight away after withdrawal from a holder. Before using polymerizing lamp reference the manual that came with it.
8.2 Foot controller

The **CHIPBLOWER** function sets a jet of a cooling air through the micromotor and turbine handpieces. Press "Chipblower" button for activation.

The **SPRAY (REVERSE/ENDO)** button on the foot controller has the following 3 functions:

1. Pressing the button once in less than 2 s will turn instrument cooling on or off. Function status is shown on the indicator next to the button on the control panel. The button has an identical function as on control panel.

2. Pressing and holding the button from 2 s up to 8 s, will change the micromotor's rotation direction; if UOZK scaler is active, press to enable SCALLING/ENDO mode. Function status is shown on the indicator next to the button .

3. Pressing and holding the button from 10 s up to 16 s, will switch cooling modes between the spray cooling and the water cooling mode. Selected mode is indicated by the indicator next to the button .

   - Cooling ON - LED indicator is on (spray coolant) or LED indicator is blinking (water coolant)
   - Cooling OFF - LED indicator is off

Pressing the foot controller lever activates the instruments and adjusts micromotor's and UOZK output from the lowest to the highest value. (Index is shown on the indicator).

To control the dental chair use **ENTRY-EXIT POSITION, CHAIR PROGRAMMING** and **JOYSTICK** buttons. See chapter 8.4 Operating the dental chair for details.

If all instruments are in their initial positions:

- **Holding the lever (pedal)** for more than 1 s, will activate bowl rinse. Holding lever for more than 4 s, will activate continuous manual bowl rinse until the lever is released. Moving the lever fast in less than 0,2 s will end the bowl rinsing.
Pressing the CHIPBLOWER button for 1 s, will activate cup fill. Holding button for more than 4 s, will activate continuous manual cup fill until the button is released. Pressing the right button fast in less than 0.2 s will end the cup fill.

8.3 Spittoon block

Possible spittoon configuration (depending upon request):
- distilled water connections
- swiveling or fixed spittoon bowl
- spittoon bowl flush and cup fill
- Cattani miniseparator system
- Cattani Mechanical amalgam trap
- saliva ejector
- depressurization for the bottle
- DP7 camera
- monitor
- electric water heater for the cup

The spittoon bowl is detachable and sterilizable.

Distilled water bottle

The distilled water bottle is located inside the spittoon block and can be accessed after the door on the side of the block is opened. Distilled water from the bottle supplies the micromotor, turbine, scaler, syringe on the dentist’s control panel and syringe on the assistant table.

How to refill distilled water bottle:
- turn off the main switch - position „0“
- open the door on the spittoon block
- screw the water bottle loose
- refill the bottle with distilled water
- screw the bottle. Avoid air leakage during the work
- turn on the main switch, position „I“
- check the bottle for air leakage
- close the door on the spittoon block

In case of air penetration to the water system caused by low water level in the bottle, it is recommended to de-aerate water paths of the instruments. It can be done by letting the water flow through the water paths until there is no air bubbles observed in the water.

Caution

Use caution when refilling the bottle. Do not allow any substances to penetrate the water. Not doing so may result in the change in water quality or in its composition. Only distilled water for medical purposes must be used! Never use water for industrial purposes!

We recommend changing the water bottle once a year. Changing and refilling the bottle is only possible when the dental unit is turned off. Depressurization system that allows a bottle refill when the dental unit is on is available upon request.

Central distribution of water

If water from the central distribution is used for cooling the instrument, distilled water in the bottle need not to be replenished – function CENTRAL. The said function is activated by turning the selector switch located in the spittoon block to the position CENTRAL (the switch in the back position).
8.3.1 3-position handpiece holder

3-position holder allows various handpiece configurations. With the large aspirator in the middle socket, small aspirator or saliva ejector, or polymerizing lamp, or syringe can be fitted in the right and left sockets. The mounting of external fourth holder for DP7 camera on the side is also possible. All the handpieces are immediately activated after withdrawn from the holder. There are also „cup fill“ and „bowl rinse“ buttons with functions identical to that of the buttons on the control panel.

8.3.2 Saliva ejector

Saliva ejector is activated automatically after withdrawal from a holder. If the output is insufficient, check and clean the sieve. See Chapter 10. Cleaning and Disinfecting for details.

8.3.3 Spittoon block configuration

Large and small aspirators
Aspirator activates immediately after withdrawal from the holder. To turn the aspirator off place it back in the holder. To control the suction, slide the regulating flap on the aspirator up or down (when the regulating flap is in the lowest position, suction is shut down). It is recommended to rinse both aspirators with 100 ml of water after each patient! Inside the aspirator there is the sieve which needs to be cleaned at least once a day (see Chapter 10 CLEANING AND DISINFECTION).

Polymerizing lamp
Polymerizing lamp activates immediately after withdrawal from the holder. Please, consult accompanying instructions before using the lamp.

Intraoral camera
The camera serves to provide better visualization during the dental treatment but not to establish final diagnosis.

Constituent parts:
- holder
- connection - connector
- camera

Caution
The product must be protected against water. Keep it dry!

8.4 Operating the dental chair

Chair can be controlled either from the control panel or with a multi-function foot controller (UNO/NOK) or with a chair foot controller.
Buttons allow to adjust the chair position as desired. \( \text{[Adjust] \text{[Adjust] \text{[Adjust]}} \). To bring the chair in entry/exit position press the quick key \( \text{[Quick]} \). Used for programming or activating previously saved chair positions.

### 8.4.1 Programming of the chair

**Writing-in of the program position**

Use these keys \( \text{[Write-in]} \) to move the chair to the desired position. To save the position use the following key: \( \text{[Save]} \). Release the key and press the \( \text{[Save]} \) key within five seconds; to assign a hot-key for the position, press one of the following keys \( \text{[Assign]} \) within the next five seconds, otherwise the custom settings will not be saved (factory settings will be recovered).

**Note**

Make sure the chair remains motionless during the programming (especially when pressing \( \text{[Keys]} \) keys); otherwise it is required to repeat programming once again.

**- Programming Entry-Exit position**

Move the chair to the desired operating position using these keys: \( \text{[Move]} \). Power off the chair, wait for approx. ten seconds, and then press \( \text{[Power]} \) key. Turn on the chair, wait for approx. ten seconds, and release the \( \text{[Power]} \) key. The new Entry-Exit position setting is programmed into memory.

**- Choosing the desired pre-set position**

First press \( \text{[Select]} \) key then press one of the following four keys \( \text{[Select]} \) within the next five seconds to move the chair to the desired pre-set position.

Double-press the \( \text{[Select]} \) key to recall the most recent position (LAST) of the chair.

**Note**

Power supply shortage may cause a detuning of the previously programmed chair position settings. Fixing the problem: move the chair from its maximum to its minimum height (or vice versa) using the two actuating mechanisms: pre-programmed positions will restore automatically. It is also advised to do so every time before reprogramming the existing chair positions.

**- Toggling between programmable sets P1/P2**
Use the key to toggle between two separate sets of programmable settings (P1 and P2) for each user.

To switch from P1 to P2 and vice versa, press and hold the key for more than five seconds.

The acoustic signal indicates that the set has been switched: one beep indicates the P1 mode, and two beeps indicate P2 mode.

The user settings remain unchanged even after the chair has been turned off.

Acoustic signal (one or two beeps) indicates the current programmable sets the next time the chair is turned on.

### 8.4.2 Chair stop

Sometimes it may come to a chair emergency stop:

1. If any object presses against the chair’s safety switch as the chair is lowered, the chair motion will be reversed automatically to prevent a damage and a warning sound signal will sound (three beeps).
2. The chair motion will stop as soon as the safety element is released. If the safety element remains pressed, the chair motion, accompanied by a warning sound signal (beeps), will continue for 2-3 seconds.
3. If any object presses against the chair’s safety switch as the backrest is lowered, the backrest motion will first interrupt and then reversed automatically to prevent damage and a warning sound signal will sound (three beeps).
4. The backrest motion will stop as soon as the safety element is released. If the safety element remains pressed, the chair motion, accompanied by a warning sound signal (beeps), will continue for 2-3 seconds.

**Warning**

Take care that no object gets stuck between a chair seat and a backrest, as it may result in damage.

The chair is secured against any accidental movement, caused by unintentional key-press, while any of a handpieces is active.

If any object passes against the chair while it is travelling, chair’s motion will be terminated and reversed to prevent damage. Bring the bowl back into its home position and then continue chair adjustment cycle.

### 8.4.3 Headrest manual adjustment

Manually-adjustable anatomically-designed headrest allows the fixation of the patient’s head in the desired convenient position for the treatment. To adjust to the desired high pull the headrest up or push it down until it is in the desired position. To adjust its angle release the adjustment lever (located on the back of the headrest). Use the lever again to fix the position when the desired angle is reached.

**Caution**

As you have finished your work it is recommended to loosen the clamp, located at the back of the headrest.
8.4.4 Rightside armrest manual adjustment

Rightside armrests for additional patient's comfort are available upon request. Armrest has two adjustments:
- tilting forward (move no.1)
- tilting down (move no.2)

To tilt the armrest forward (move no.1)

- Grasp the armrest and rotate it toward the toe from position no.1 to position no.4
- To bring the armrest back into standard position lower it from the position no.4 into position no.3 and lift it up until you hear "click" sound, confirming that the armrest is locked in place.

To tilt the armrest down (move no.2)
- Grasp the armrest and lift it from position no.1 into position no.2, then it can be lowered into the position no.3
- To bring the armrest back lift it up from the position no.3 until you hear “click” sound, confirming that the armrest is locked in place.

8.5 Dental operating light

Sirius or Xenos
Please, consult accompanying instructions before using the dental operating light.

8.6 Completion of work

It is important to do the following:
- toggle the main switch to position „0“ to depressurize the whole system
- shut off the main water supply at the workplace
- turn off the compressor – open the sludge valve
- turn off the aspirator (depending upon the model)

9 PRODUCT MAINTENANCE

For appropriate handpieces and instruments maintenance, please, follow the instructions given by the manufacturer. If the cuspidor block is connected to the central distribution system, check the cleanliness of the strainer and the water hardness treatment system condition (in reference to the manufacturer’s instructions).

Inspections within the warranty period

It is required to have the dental unit checked by authorized service technician every 3 months within the warranty period.

The preventive inspection focuses on the following:
- checking the input filters (with regard to the cleanliness of utilities)
- checking the suction system
- checking the waste hose
- providing additional information and practical advices concerning the maintenance dental unit
- check if the dental unit and the instruments are used and maintained properly (according to the Instructions for Use)
• the manufacturer estimates the duration of a service check to be approx. from 1 up to 1.5 hours
• checking and/or adjusting all utilities (input, setting of turbine pressures etc.)
• authorized service technician is obliged to confirm the periodical inspection in the warranty card.

Inspection and revision upon the expiration of the warranty period:
It is required to have the dental unit checked by authorized service technician every 6 months.

The following should be done:
• complex inspection of the dental unit and its functional parts
• checking and adjustment of the water and air working pressure
• checking the input air filter in the power block
• checking of the integrity of the electronics and electrical wiring (electrical safety).
• perform a complete check-up of the chair and its functional components
• check the chair's backrest tilting mechanism
• check and/or adjust chair's safety elements
• check the integrity of the electronics
• perform a safety test according to country-specific regulations

Revision of electrical safety
Is performed according to prevailing local codes of the country where the unit is installed.

10 CLEANING, DISINFECTION AND DECONTAMINATION

Disinfecting the internal distilled water tubings
It is recommended to use "Alpron" cleaning agent. A 1% "Alpron" solution with distilled water is poured into reservoir for distilled water and can be used continuously. The 1% concentration is harmless to the patient. The continuous use of Alpron solution helps to keep the cooling system clean and it is not necessary to use other disinfecting agents. Alpron cleaning agent is produced by Alpro Medical (Germany). For additional information and purchase details, please, contact your dealer.

In the event that water from the central distribution is used for the cooling of instruments, disinfection of the internal distributions of the instruments is made as follows:

1. Fill the reservoir of distilled water with 1% solution of Alpron with distilled water.
2. Turn the 3-position selector switch to the position „DISTIL“
3. Rinse the water path of an instrument for 30s; other instruments that use cooling water are rinsed for 10s.
4. Turn the 3-position selector switch to the position „CENTRAL“

The manufacturer recommends to carry out the above disinfection at least once a day, preferably at the end of the working day.

Decontaminating the cuspidor bowl
It is recommended to use SAVO Prim cleaning agent, if the dental unit is configured with saliva ejector only. Decontamination of the cuspidor bowl should be performed at least once a day (e.g. after finishing the work). Pour at least 200ml of a 1% SAVO Prim solution into the cuspidor bowl.

It is required to use PULI - JET PLUS cleaning agent, if the unit is configured with an aspirator and Cattani separator. Use at least 200ml of a 0,8% solution to clean the cuspidor bowl.
Cleaning and decontaminating the saliva ejector
It is required to perform a decontamination of the saliva ejector at least once a day (e.g. after finishing the work). Prepare at least 100 ml of a 1% SAVO Prim solution and suck in this solution with the tip of a saliva ejector. Rinse ejector’s hose with min. 100 ml of water after each patient. Saliva ejector handpieces are for single use only! Clean the ejector’s sieve at least once a day to avoid contamination. fig. 10.1.

1. saliva ejector sieve

Cleaning and decontaminating the large and small aspirators
It is required to check the catcher sieve in the cuspidor for solid particles at least once a day. Clean the sieve if needed to avoid contamination. Rinse aspirators’ hoses with min. 100 ml of water after each patient

Caution
Aspirator tips are sterilizable up to the 135°C
1. big aspirator – tip
2. small aspirator- tip
3. filter, rough P22
4. filter, rough P16
5. adapter for single-use saliva ejector tip
6. regulating flap
7. single-use handpiece of the saliva ejector

Cleaning other parts of the dental unit
Clean the external surfaces of the unit with a wet cloth. Use the INCIDIN FOAM – spray (HENKEL – ECOLAB) agent (refer the instructions for use) at least once a day or when the equipment surface was incidentally contaminated with biological material.

Clean the following parts at least once a day (depending upon the model):
- aspirator sieve inside the large and small aspirator on the assistant arm (fig. 10.2)
- suction sieve inside the spittoon block (fig. 10.3)
- saliva ejector sieve (fig. 10.1)
- spittoon bowl sieve

It is recommended to rinse the large and small aspirator hoses with max. 0.5 l water at the end of each shift!

Caution
When cleaning the floor (PVC floor) with a cleaning agent, it is forbidden to place the foot controller on the wet floor. Do not use phenol- and aldehyde-based cleaning agents; they can permanently damage the structure of varnish and plastic surfaces.
The manufacturer will take no responsibility for the damage resulted from using inappropriate cleaning agents.

**Instruements and handpieces**

Before cleaning a handpiece, please, reference its "care and maintenance instructions" that came with it, for the accurate information.

**Cattani disinfecting anti-foaming tablets for dental aspirators. Instructions for Use**

Even if the unit is regularly and properly cleaned, blood and mucus under negative pressure create a great amount of foam anyway. This may result in frequent undesired abruption of suction.

Simply place the tablet (do not remove the protective dissolvable film, that ensures safe keeping and handling, even though the product is not classified as dangerous) in the filter of the tip and suck in the small amount of water through it for immediate anti-foaming effect. When placing the tablet in very small slots, protective film should be removed (wear suitable gloves) and the pill broken in two parts (press along the marked line) to allow insertion of the two halves into the filter system. As the liquid passes through the tablet will release disinfecting and anti-foaming agents for the whole working day.

High efficiency is enabled by ortho-fталdehyde as the active disinfecting component. Its efficiency has been proven by the official tests for Staphylococcus aureus, Pseudomonas aeruginosa, Enterococcus hirae and Candida Albicans.

Internal disinfection of the suction system and sucked-off debris is combined with the anti-foaming effect for safe and odour-free system operation. According to the CE I classification, this product is classified as a „medical substance”. Certified quality system UNI EN ISO 9001/2000.

**PULI – JET PLUS cleaning agent.**

PULI – JET PLUS is a non-foaming aldehyde-free concentrate used for disinfection, deodorizing, cleaning and maintaining dental aspirators of all types (semi-wet, wet, dry). It is recommended to disinfect the suction system at the end of each working day and clean it at least once in the middle of the day. PULI – JET PLUS leaves a residue on the inside of the pipes to prevent the accumulation of bacterial growth. PULI – JET PLUS is certified as germ-killer, fungicidal and antiviral agent. It is generally recommended to improve and refine the quality of disinfecting procedures to minimize the contamination risk.

**Instructions for use**

How to fill the doser: place the bottle in the vertical position, preferable on a flat surface. Unscrew the lid and fill the doser to the edge by squeezing the bottle gently at the points marked with two labels (take care not to overfill it). Release the pressure: excessive amount of the liquid returns back to the bottle while the exact amount (10ml) of the concentrate remains in the doser. Concentrated PULI – JET PLUS after dilution to 0,8% cleans and disinfects, to 0,4% it is only sanitary cleaning agent. Free sample of concentrated Pul-Jet PLUS (10 ml) equals to the content of one doser. 1,25l disinfecting and 2,5l sanitary solution can be prepared out of it.

For cleaning and disinfection dilute two doses of the doser (two free samples) in 2,5l of warm water (50°C) and suck 1l with big aspirator and 1l with small aspirator and pour 0,5l into the bowl. For the very cleaning of the system dilute one dose of the doser (one free sample). Do not rinse, proteolytic and disinfecting effect of PULI – JET PLUS reveals with time.

**Useful notes**

Puli-Jet PLUS is supplied commercially in 1 liter bottles: out of 1 liter of Puli-Jet PLUS concentrate you will prepare 250 liters of sanitary solution or 125 liters of disinfecting solution. Puli-Jet PLUS enables you to save on transport cost (70 %), the dispensive nozzle fitted in the lid, 1-litre bottle is easy to handle and it is not graduated. We recommend Puli-Jet PLUS as, when used regularly, it contributes to good maintenance of the aspirator by keeping it clean and...

11 DISPOSAL OF THE EQUIPMENT

Note
Equipment has to be disposed according to the regulations specific to your local area. Clean the surface, rinse the suction and waste systems, remove the amalgam from the trap and pass it on to a scrap material collecting facility. It is recommended to hire a specialist for disposing the unit.
Cleaning should be done prior to dismantlement!

Caution
Not to be disposed of with the communal waste! Waste material can be handed in at destined places, e.g. electro waste drop-off!

12 REPAIR SERVICE
In case of a breakdown, contact the nearest service centre or your dealer, who will provide you with information about the service network.

14 WARRANTY
The manufacturer covers the warranty in accordance with the warranty card.
The responsibility for any damage is shifted to the buyer after the item has been passed over to the forwarding agent for expedition and/or after the item is has been received directly by the buyer. The information in these Instructions for use is subject to change subsequently to the further product innovations without notice.

Caution
The warranty does not cover the damage resulting from misuse or/and failure to maintain the product in accordance with instructions for use that came with it.

15 TRANSPORTING AND STORAGE

15.1 Transporting
Packages should be transported in covered vehicles in max. 3 plies and secured to prevent
movement. Do not drop or tilt the package while loading or unloading.

### 15.2 Storage

Dental units can be stored in dry indoor warehouses in max. 3 plies with no dramatic temperature changes. Protect non-varnished parts from corrosion with rust-preventive treatment. Do not store together with chemicals! Required environmental conditions: relative humidity at max. 75 %, temperature range for transporting and storage: -25 °C to +50 °C.
